

Functional variation across V1 locations and higher visual areas

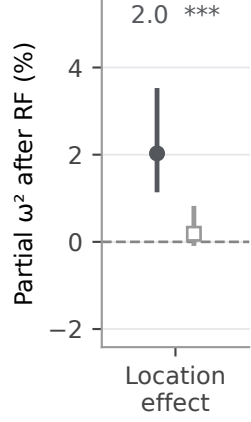

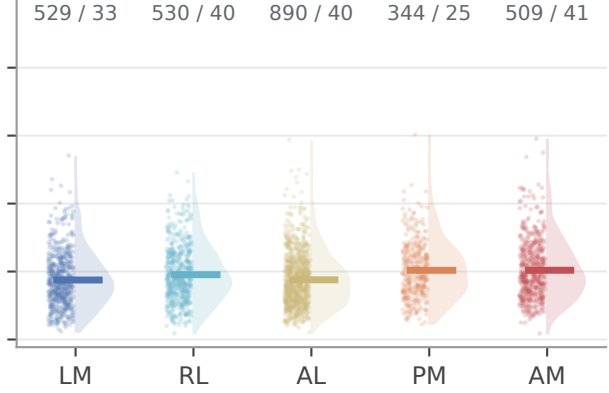

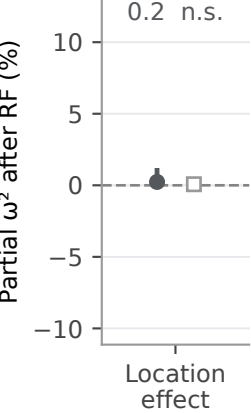

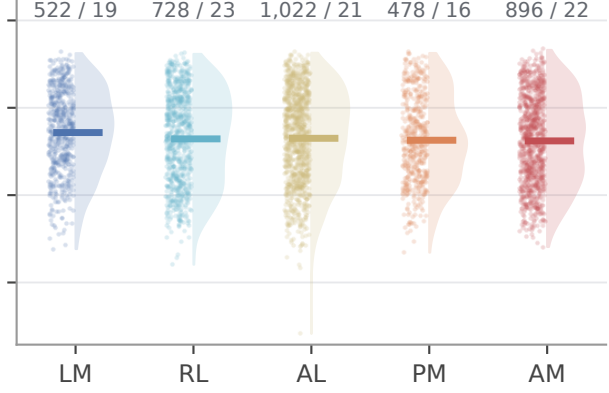

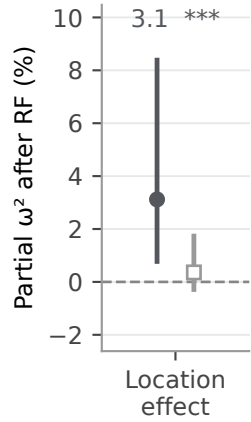

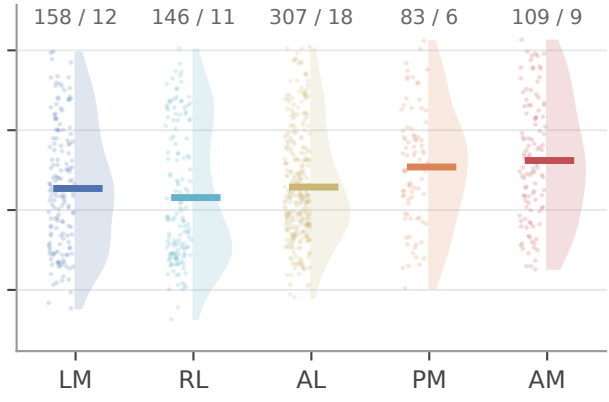

Single-cell version with Central · adjusted for RF azimuth/elevation · RF model refitted in every session bootstrap

● Observed + 95% session bootstrap interval □ Location-block shuffle: median + central 95%

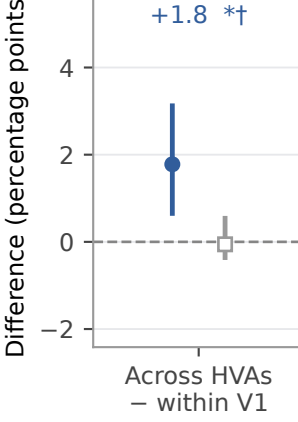

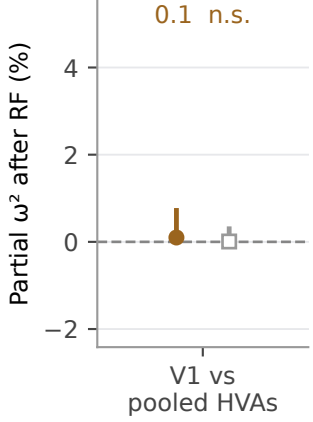

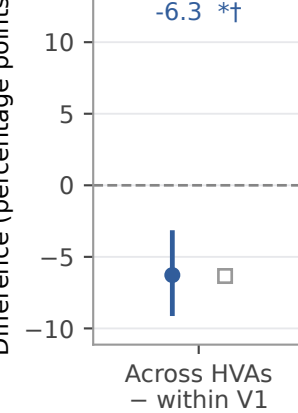

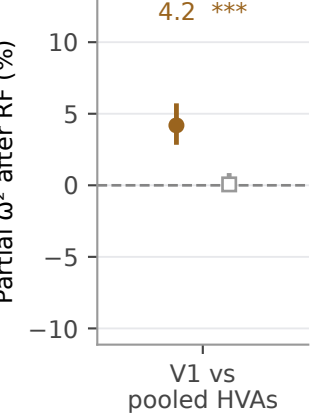

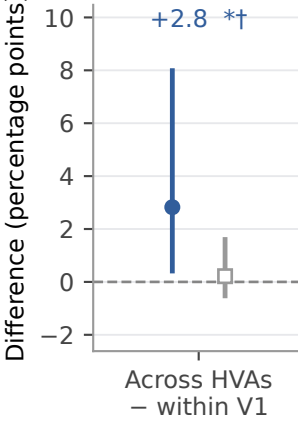

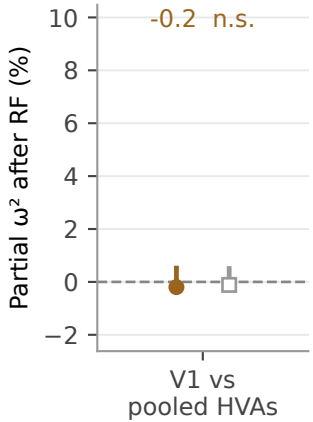

C Within V1

D Across HVAs

E Control and main comparison

C/D: neuron measurements adjusted to the pooled RF-feature mean; bars = cell means; counts = cells / sessions.
Quadratic display RF azimuth/elevation adjustment; no gaze correction. Effects = bias-corrected partial ω^2 , which can be negative.
Central = legacy Allen V1, a separate cohort/processing pipeline; included in V1 effects and E differences.
Uncorrected one-sided shuffle tests: * $p < .05$; ** $p < .01$; *** $p < .001$; n.s. $p \geq .05$.
† Difference: * = 95% bootstrap interval excludes zero; n.s. = includes zero (not an equivalence test or shuffle p-value).
‡ V1 shuffle holds Central fixed and tests only the four MouseV2 labels. Shared Allen sessions are bootstrapped jointly.
