

Response variation within V1 and across higher visual areas

Dots are session $\times$ probe/area means; faint lines join the same session; boxes show the session-level IQR and 10th-90th percentiles; thick bars are mean $\pm$ 95% CI.

Y-scales are matched across columns within each row. Allen V1Sp is a session-level regional reference, not another MouseV2 probe. Absolute MouseV2-Allen centers are not protocol-calibrated; compare spatial variation within each dataset.
